Abstract

The function $\psi(z) = 2/(1+z) + 1/(\log(1-z)/2)$, holomorphic in the cut plane $\mathbb{C} \setminus [1, \infty[$, is shown to be a Pick function. This leads to an integral representation of the coefficients in the power series expansion $\psi(z) = \sum_{n=0}^{\infty} \beta_n z^n$, |z| < 1. The representation shows that (β_n) decreases to zero as conjectured by F. Topsøe. Furthermore, (β_n) is completely monotone.

2000 Mathematics Subject Classification: 30E20, 44A60. Key words: Pick functions, completely monotone sequences.

1. Introduction and Statement of Results

In the paper [2] about bounds for entropy Topsøe considered the function

(1.1)
$$\psi(x) = \frac{2}{1+x} + \frac{1}{\ln\frac{1-x}{2}}, \quad -1 < x < 1$$

with the power series expansion

(1.2)
$$\psi(x) = \sum_{n=0}^{\infty} \beta_n x^n$$

and conjectured from numerical evidence that (β_n) decreases to zero.

The purpose of this note is to prove the conjecture by establishing the integral representation

(1.3)
$$\beta_n = \int_1^\infty \frac{dt}{t^{n+1}(\pi^2 + \ln^2 \frac{t-1}{2})}, \quad n \ge 0.$$

This formula clearly shows $\beta_0 > \beta_1 > \cdots > \beta_n \to 0$. Furthermore, by a change of variable we find

$$\beta_n = \int_0^1 s^n \frac{ds}{s(\pi^2 + \ln^2 \frac{1-s}{2s})}, \quad n \ge 0,$$

which shows that (β_n) is a completely monotone sequence, cf. [3].

The representation (1.3) follows from the observation that ψ is the restriction of a Pick function with the following integral representation

(1.4)
$$\psi(z) = \int_{1}^{\infty} \frac{dt}{(t-z)(\pi^2 + \ln^2 \frac{t-1}{2})}, \quad z \in \mathbb{C} \setminus [1, \infty[.$$

From (1.4) we immediately get (1.3) since $\beta_n = \psi^{(n)}(0)/n!$.

2. Proofs

A holomorphic function $f : \mathbb{H} \to \mathbb{C}$ in the upper half-plane is called a Pick function, cf. [1], if $\operatorname{Im} f(z) \geq 0$ for all $z \in \mathbb{H}$. Pick functions are also called Nevanlinna functions or Herglotz functions. They have the integral representation

(2.1)
$$f(z) = az + b + \int_{-\infty}^{\infty} \left(\frac{1}{t-z} - \frac{t}{1+t^2}\right) d\mu(t),$$

where $a \ge 0, b \in \mathbb{R}$ and μ is a non-negative Borel measure on \mathbb{R} satisfying

$$\int \frac{d\mu(t)}{1+t^2} < \infty$$

It is known that

(2.2)
$$a = \lim_{y \to \infty} f(iy)/iy, \ b = \operatorname{Re} f(i), \ \mu = \lim_{y \to 0^+} \frac{1}{\pi} \operatorname{Im} f(t+iy)dt,$$

where the limit refers to the vague topology. Finally f has a holomorphic extension to $\mathbb{C} \setminus [1, \infty[$ if and only if supp $(\mu) \subseteq [1, \infty[$.

Let $\operatorname{Log} z = \ln |z| + i \operatorname{Arg} z$ denote the principal logarithm in the cut plane $\mathbb{C} \setminus]-\infty, 0]$, with $\operatorname{Arg} z \in]-\pi, \pi[$. Hence $\operatorname{Log} \frac{1-z}{2}$ is holomorphic in $\mathbb{C} \setminus [1, \infty[$ with z = -1 as a simple zero. It is easily seen that

(2.3)
$$\psi(z) = \frac{2}{1+z} + \frac{1}{\log \frac{1-z}{2}}, \quad z \in \mathbb{C} \setminus [1, \infty[$$

J. Ineq. Pure and Appl. Math. 2(2) Art. 26, 2001 http://jipam.vu.edu.au

is a holomorphic extension of (1.1) with a removable singularity for z = -1where $\psi(-1) = 1/2$. To see that $V(z) = \operatorname{Im} \psi(z) \ge 0$ for $z \in \mathbb{H}$ it suffices by the boundary minimum principle for harmonic functions to verify $\liminf_{z \to x} V(z) \ge 0$ for $x \in \mathbb{R}$ and $\liminf_{|z| \to \infty} V(z) \ge 0$, where in both cases $z \in \mathbb{H}$.

We find

$$\lim_{z \to x} \psi(z) = \begin{cases} \psi(x) \,, & x \le 1 \text{ (with } \psi(1) = 1) \\ \\ \frac{2}{1+x} + \frac{1}{\ln \frac{x-1}{2} - i\pi} \,, & x > 1 \end{cases}$$

hence

$$\lim_{z \to x} V(z) = \begin{cases} 0, & x \le 1 \\ \\ \frac{\pi}{\pi^2 + \ln^2 \frac{x-1}{2}}, & x > 1, \end{cases}$$

whereas $\lim_{|z|\to\infty} \psi(z) = 0$. This shows that ψ is a Pick function, and from (2.2) we see that a = 0 and μ has the following continuous density with respect to Lebesgue measure

$$d(x) = \begin{cases} 0, & x \le 1\\ \frac{1}{(\pi^2 + \ln^2 \frac{x-1}{2})}, & x > 1. \end{cases}$$

Therefore

$$\psi(z) = b + \int_{1}^{\infty} \left(\frac{1}{t-z} - \frac{t}{1+t^2}\right) \frac{dt}{\pi^2 + \ln^2 \frac{t-1}{2}}$$

J. Ineq. Pure and Appl. Math. 2(2) Art. 26, 2001 http://jipam.vu.edu.au

In this case we can integrate term by term, and since $\lim_{x\to -\infty} \psi(x) = 0$, we find

$$\psi(z) = \int_1^\infty \frac{dt}{(t-z)(\pi^2 + \ln^2 \frac{t-1}{2})}$$

and

$$b = \operatorname{Re} \psi(i) = 1 - \frac{8 \ln 2}{\pi^2 + 4 \ln^2 2} = \int_1^\infty \frac{t dt}{(1 + t^2)(\pi^2 + \ln^2 \frac{t - 1}{2})},$$

which establishes (1.4).
