THE ASN FUNCTION FOR CURTAILED SINGLE SAMPLING BY ATTRIBUTES

Anders Hald and Uffe M $\phi 11 e r$ Institute of Mathematical Statistics University of Copenhagen

## Summary

The ASN/n for curtailed and semicurtailed single sampling by attributes is found as function of the acceptance probability (OC) for the binomial and the Poisson distribution. The two binomial ASN/n functions are approximated by means of the corresponding Poisson function. A table of ASN/n for the Poisson case is given and it is shown that the relative error of the approximations is small. An approximation based on the normal distribution is also derived.

## Key Words

Curtailed sampling. Semicurtailed sampling. Binomial distribution. Poisson distribution. Table of ASN/n. Approximation to ASN/n.

Let n denote the sample size and c the acceptance number for a binomially distributed random variable with parameter p. It is wellknown, see for example Statistical Research Group, Columbia University [6], that the ASN divided by $n$ for fully curtailed sampling equals

$$
\mathrm{e}(\mathrm{p})=\mathrm{B}(\mathrm{c}, \mathrm{n}+1, \mathrm{p})(\mathrm{n}-\mathrm{c}) / \mathrm{nq}+\{1-\mathrm{B}(\mathrm{c}+1, \mathrm{n}+1, \mathrm{p})\}(\mathrm{c}+1) / \mathrm{np},
$$

where $B(c, n, p)$ denotes the binomial distribution function. If curtailment takes place only in connection with rejection the first term in the formula above should be replaced simply by $B(c, n, p)$ and we shall denote this semicurtailed ASN/n by $e_{b}$. A table of $e$ and/or $e_{b}$ will be rather voluminous because e depends on three variables ( $c, n, p$ ), see B1yth and Hutchinson [1].

It seems natural to investigate the corresponding Poisson formula, $e_{g}$ say, which depends on two parameters only, and try to approximate e and $e_{b}$ using $e_{g}$ as the main term in the approximation.

Deducing the Poisson formula directly or from the binomial formula by passing to the limit in the usual way $(\mathrm{p} \rightarrow 0, \mathrm{n} \rightarrow \infty$ and fixed $\mathrm{np}=\mathrm{m}$ ) we get

$$
e_{g}(m)=G(c, m)+\{1-G(c+1, m)\}(c+1) / m,
$$

where $G(c, m)$ denotes the Poisson distribution function. Note that $e_{g}$ corresponds to $e_{b}$ because we cannot have curtailment by acceptance under Poisson conditions.

Since the derivative of $e_{g}(m)$ is negative it follows that $e_{g}(n p)$ decreases from 1 to

$$
\mathrm{e}_{\mathrm{g}}(\mathrm{n})=\mathrm{G}(\mathrm{c}, \mathrm{n})+\{1-\mathrm{G}(\mathrm{c}+1, \mathrm{n})\}(\mathrm{c}+1) / \mathrm{n}
$$

as $p$ increases from 0 to 1 . Similarly $e_{b}(p)$ decreases from 1 to ( $\left.c+1\right) / n$.

It may be proved that $e_{b}(p)>e_{g}(n p)$ for $0<p \leqq 1$. It follows from the definitions that $e(p)<e_{b}(p)$ for $0<p<1$. Furthermore, for $0<c<n-1$ $e(p)$ first increases from $e(0)=(n-c) / n$ to a maximum and then decreases to $e(1)=(c+1) / n$. Consequently $e(p)$ and $e_{g}(n p)$ intersect. An example has been shown in Fig.1. (To demonstrate the characteristic features of the curves and the differences between them we have chosen rather small values of $n$ and c.)

Fig. 1. Comparison of the three ASN/n curves as functions of the fraction defective for $\mathrm{n}=10$ and $\mathrm{c}=2$.

Normally we are interested in the ASN corresponding to a known value of the OC. We shall therefore transform the three functions above so that they become functions of the acceptance probability. Let us define $p_{\alpha}$ and $m_{\alpha}$ as solutions to the equations $B\left(c, n, p_{\alpha}\right)=\alpha$ and $G\left(c, m_{\alpha}\right)=\alpha$, respectively, $0 \leqq \alpha \leqq 1$. Note that this definition of $\mathrm{m}_{\alpha}$ means that $\mathrm{m}_{\alpha}$ is different from $n \mathrm{p}_{\alpha}$. As shown by Hald [3] it follows from a result by Wise [7] that

$$
\begin{equation*}
\mathrm{m}_{\alpha} / \mathrm{np}_{\alpha}=1+\left(\mathrm{m}_{\alpha}-\mathrm{c}\right) / 2 \mathrm{n}+0\left(\mathrm{n}^{-2}\right), \tag{1}
\end{equation*}
$$

which may be used to find $p_{\alpha}$ from $m_{\alpha}$ with sufficient accuracy for most applications in sampling inspection. Tables of $\mathrm{m}_{\alpha}$ have been given by Hald and Kousgaard [4] and Burstein [2]; $m_{\alpha}=m_{\alpha}$ (c) may also be found as $\frac{1}{2} x_{1-\alpha}^{2}(2 c+2)$.

$$
\text { Setting } e_{g}\left(m_{\alpha}\right)=E_{g}(\alpha) \text { and } e\left(p_{\alpha}\right)=E(\alpha) \text { it is straightforward to }
$$ show that

$$
\begin{align*}
& \mathrm{E}_{\mathrm{g}}(\alpha)=\alpha+(1-\alpha)(\mathrm{c}+1) / \mathrm{m}_{\alpha}-\mathrm{g}\left(\mathrm{c}, \mathrm{~m}_{\alpha}\right),  \tag{2}\\
& \mathrm{E}_{\mathrm{b}}(\alpha)=\alpha+(1-\alpha)(\mathrm{c}+1) / \mathrm{n} p_{\alpha}-\mathrm{b}\left(\mathrm{c}, \mathrm{n}, \mathrm{p}_{\alpha}\right)(\mathrm{n}-\mathrm{c}) / \mathrm{n} \tag{3}
\end{align*}
$$

and

$$
\begin{equation*}
E(\alpha)=E_{b}(\alpha)+\alpha\left(n p_{\alpha}-c\right) / n q_{\alpha}-b\left(c, n, p_{\alpha}\right) p_{\alpha}(n-c) / n q_{\alpha}, \tag{4}
\end{equation*}
$$

where $g(c, m)$ and $b(c, n, p)$ denote the frequency functions for the Poisson and binomial distributions, respectively. Closely related results for the binomial have been given by Shah and Phatak [5].

Graphs of the three functions corresponding to Fig. 1 are shown in Fig. 2.

Fig. 2. Comparison of the three ASN/n curves as functions of the probability of acceptance for $n=10$ and $c=2$.

From (2) and (3) we have

$$
E_{b}(\alpha)=E_{g}(\alpha)+(1-\alpha) \frac{c+1}{m_{\alpha}}\left[\frac{m_{\alpha}}{n p_{\alpha}}-1\right]+g\left(c, m_{\alpha}\right)-b\left(c, n, p_{\alpha}\right) \frac{n-c}{n}
$$

Replacing $b\left(c, n, p_{\alpha}\right)$ by $g\left(c, m_{\alpha}\right)(1+(c / 2 n))$, see Lemma 2 in the Appendix, using (2) to eliminate $g\left(c, m_{\alpha}\right)$ and inserting (1) we get

$$
\begin{equation*}
\mathrm{E}_{\mathrm{b}}(\alpha)=\mathrm{E}_{\mathrm{g}}(\alpha)+\left\{(1-\alpha)+\mathrm{c}\left(1-\mathrm{E}_{\mathrm{g}}(\alpha)\right)\right\} / 2 \mathrm{n}+0\left(\mathrm{n}^{-2}\right) \tag{5}
\end{equation*}
$$

Noting that the correction to $E_{b}(\alpha)$ in (4) is $0\left(n^{-1}\right)$ we get

$$
\begin{aligned}
E(\alpha) & =E_{b}(\alpha)+\left\{\alpha\left(m_{\alpha}-c\right)-g\left(c, m_{\alpha}\right) m_{\alpha}\right\} / n+0\left(n^{-2}\right) \\
& =E_{b}(\alpha)+\left\{m_{\alpha} E_{g}(\alpha)+\alpha-c-1\right\} / n+0\left(n^{-2}\right),
\end{aligned}
$$

where we have used (2) to eliminate $g\left(c, m_{\alpha}\right)$. Inserting (5) we finally get

$$
\begin{equation*}
E(\alpha)=E_{g}(\alpha)+\left\{E_{g}(\alpha)\left(2 m_{\alpha}-c\right)+\alpha-c-1\right\} / 2 n+0\left(n^{-2}\right) \tag{6}
\end{equation*}
$$

(5)

To compute the approximation ${ }^{\text {(6) }}$ to $E_{b}(\alpha)$ we need only a table of $E_{g}(\alpha)$ whereas the approximation ${ }^{\gamma}$ to $E(\alpha)$ requires a table of $m_{\alpha}$ as well. Both approximations are simple to compute and rather accurate as will be shown in the following.

Table 1 contains values of $\mathrm{E}_{\mathrm{g}}(\alpha)$ for 9 commonly used values of $\alpha$ and $c=1(1) 20(2) 50(5) 70(10) 100$.

Table 2 contains for $c=5$ and $n=20$ and 50 the values of $E_{g}(\alpha)$, $E_{b}(\alpha)$ and $E(\alpha)$ and the errors, $\Delta_{b}$ and $\Delta$, i.e. the approximations computed form (5) and (6) minus the exact values. It will be seen that the error decreases with n and that the error even for $\mathrm{n}=20$ is rather sma11.

A survey of the relative error is given in Table 3 which shows that the absolute value of the relative error by using the approximations for $n \geqq 20$ and $(c+1) /(n+1) \leqq 0.25$ is at most 1.80 per cent for $0.01 \leqq \alpha \leqq 0.99$. The maximum of the relative error is normally found for rather small values of $n$, so that for large values of $n$ the relative error will be considerably smaller than the maximum shown in Table 3.

Table 1. The $A S N / n=E_{g}(\alpha)$ as function of the acceptance probability for the Poisson distribution.

To complete the investigation we shall derive an approximation to $E_{g}(\alpha)$ based on the normal distribution. From the Edgeworth expansion we have

$$
g(c, m)=\{\phi(u) / \sqrt{c+1}\}\left\{1+\left(u^{3}-3 u\right) /(3 \sqrt{c+1})+0\left(c^{-1}\right)\right\}
$$

where $\phi(u)$ denotes the standardized normal density function and $u=$ $(m-c-1) / \sqrt{c+1}$. (The expansion is found from the expansion of the gamma distribution using the relation between the Poisson and the gamma distributions.) Similarly, the Cornish- Fisher expansion gives

$$
m_{\alpha}=(c+1)\left\{1-u_{\alpha} / \sqrt{c+1}+\left(u_{\alpha}^{2}-1\right) /(3(c+1))+0\left(c^{-3 / 2}\right)\right\}
$$

where $\Phi\left(u_{\alpha}\right)=\alpha, \Phi(u)$ denoting the standardized normal distribution function. Inserting these expansions into (2) we get

$$
\begin{align*}
\mathrm{E}_{\mathrm{g}}(\alpha)=1 & +\left\{(1-\alpha) \mathrm{u}_{\alpha}-\phi\left(\mathrm{u}_{\alpha}\right)\right\} / \sqrt{c+1} \\
& +\left\{(1-\alpha)\left(2 u_{\alpha}^{2}+1\right)-\phi\left(u_{\alpha}\right)\left(u_{\alpha}^{3}-3 u_{\alpha}\right)\right\} /(3(c+1))+0\left(c^{-3 / 2}\right) \tag{7}
\end{align*}
$$

The error of this approximation has been illustrated in Table 4. It will be seen that the error is a decreasing function of $c$ and that the approximation is satisfactory for most practical purposes for c $>50$.

Analogous results may be found for $E_{b}(\alpha)$ and $E(\alpha)$ by means of expansions of the beta distribution.

Table 4. Errors by using the approximation (7) to $\mathrm{E}_{\mathrm{g}}(\alpha)$.

## Appendix

Lemma 1. For fixed $c$ and $m, 0<m<\infty, p=m / n$ and $n \rightarrow \infty$ we have

$$
\mathrm{b}(\mathrm{c}, \mathrm{n}, \mathrm{p})=\mathrm{g}(\mathrm{c}, \mathrm{np})\left\{1+\mathrm{p}\left(\mathrm{c}-\frac{1}{2} \mathrm{np}\right)-\left(\mathrm{c}^{2}-\mathrm{c}\right) / 2 \mathrm{n}+0\left(\mathrm{n}^{-2}\right)\right\}
$$

Proof. This result follows immediately from an expansion of
ln $\{b(c, n, p) / g(c, n p)\}$ using Stirling's formula for $1 n n$ ! and the power series expansion for $\ln (1-p)$.

Lemma 2. For fixed $c$ and $\alpha, 0<\alpha<1$, and $n \rightarrow \infty$ we have

$$
\mathrm{b}\left(\mathrm{c}, \mathrm{n}, \mathrm{p}_{\alpha}\right)=\mathrm{g}\left(\mathrm{c}, \mathrm{~m}_{\alpha}\right)\left\{1+\mathrm{c} / 2 \mathrm{n}+0\left(\mathrm{n}^{-2}\right)\right\}
$$

Proof. From (1) we get

$$
n p_{\alpha}=m_{\alpha}-m_{\alpha}\left(m_{\alpha}-c\right) / 2 n+0\left(n^{-2}\right),
$$

which by means of Taylor's expansion gives

$$
\mathrm{g}\left(\mathrm{c}, \mathrm{np} \mathrm{p}_{\alpha}\right)=\mathrm{g}\left(\mathrm{c}, \mathrm{~m}_{\alpha}\right)\left\{1+\left(\mathrm{m}_{\alpha}-\mathrm{c}\right)^{2} / 2 \mathrm{n}+0\left(\mathrm{n}^{-2}\right)\right\} .
$$

Combining this result with Lemma 1 for $p=p_{\alpha}$ Lemma 2 follows.
